

Sakura Notes

桜ノート

a washi-paper template — make it yours

1 Getting started

Write normal prose with inline math like $e^{i\pi} + 1 = 0$ and display math:

$$\int_{-\infty}^{\infty} e^{-x^2} dx = \sqrt{\pi}.$$

DEFINITION A term

Definitions sit in plum boxes. The optional argument is the term name.

THEOREM A central result

Theorems sit in deep-rose boxes — the things you quote and rely on.

WORKED EXAMPLE 1 · a worked problem

Worked examples sit in green boxes. Carry the algebra out in full:

$$a^2 - b^2 = (a - b)(a + b).$$

INTUITION the mental picture

Gold boxes are for the “why” — the idea behind the formula in plain words.

A LIST OF RULES

- ◆ rules and properties go in pink boxes;
- ◆ the bullets are little sakura diamonds;
- ◆ keep each point short.

AN ASIDE

Grey boxes hold caveats, footnotes, or “mind this” remarks.

A formula worth memorising goes in a centred key box:

$$\mathcal{F}\{f * g\} = F(\omega)G(\omega)$$

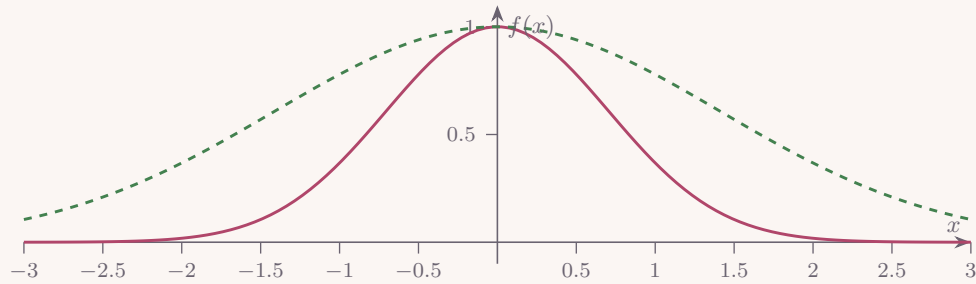

PART II

Diagrams ☒

2 A themed plot

The `sakuraxis` pgfplots style matches the palette automatically:

Two Gaussians in the house colours.

3 Colours you can use

The exposed colour names are `sakura`, `sakuradeep`, `matcha`, `kin`, `ai` (plum), plus `ink`, `inkdim`, `pagebg`, `boxbg`. Override any of them after the `\usepackage` line with `\definecolor`.
